GROUP ART UNIT 3653

SERIAL No.: 10/020,647 ATTORNEY DOCKET No.: 29096/37999

**Listing of Claims:** 

1. (Previously presented) A sealed wheel case for use on a vibratory

device for vibrating aggregate material, the vibratory device having a frame and a

rotating shaft extending transversely across the frame and having a wheel, a driven

portion of the shaft being operatively coupled to a drive system, the sealed wheel case

comprising:

a housing having a base, a peripheral sidewall, and a cover, the housing being

sized to receive therein the wheel and further being adapted to house therein a quantity

of lubricating oil for lubricating the wheel, the cover including an aperture adapted to

receive therethrough the driven portion of the shaft;

a seal operatively connected to the shaft adjacent the aperture of the cover;

an annular baffle mounted to an inside surface of the cover and extending into

the wheel case, the annular baffle positioned on the inside surface of the cover to

generally surround the shaft and the seal;

a plurality of attachment bolts for securing the housing to the frame, each

attachment bolt including a shank having an inner end and an outer end, and a pressed

on collar sized to be received on the shank from the inner end;

at least a washer disposed between the inner end and the outer end; and

at least an O-ring disposed between the inner end and the outer end, the O-ring

being concentric with the washer;

wherein the pressed on collar and the outer end of each attachment bolt press

the washer and the O-ring to sealably secure the housing to the frame.

2

GROUP ART UNIT 3653

SERIAL NO.: 10/020,647 ATTORNEY DOCKET NO.: 29096/37999

2. (Original) The sealed wheel case of claim 1, wherein the seal is a labyrinth seal.

- 3. (Original) The sealed wheel case of claim l, wherein the annular baffle includes an inner edge, the inner edge being disposed adjacent the wheel to form a gap therebetween.
- 4. (Previously presented) The sealed wheel case of claim 1, the annular baffle having an inner edge disposed generally adjacent the wheel, the annular baffle sized to define an annular gap between the inner edge of the annular baffle and the wheel, the annular baffle sized to minimize the size of the gap to thereby shield the seal from the lubricating oil.
  - 5. (Canceled)
- 6. (Currently amended) [[The device of claim 5,]] A sealed wheel case for use on a vibratory device for vibrating aggregate material, the vibratory device having a frame and a rotating shaft extending transversely across the frame and having a wheel, a driven portion of the shaft being operatively coupled to a drive system, the sealed wheel case comprising:

a housing having a base, a peripheral sidewall, and a cover, the housing defining an interior sized to receive the wheel, the housing adapted to hold quantity of lubricating oil for lubricating the wheel, the cover including an aperture adapted to receive therethrough the driven portion of the shaft;

GROUP ART UNIT 3653 SERIAL NO.: 10/020,647

ATTORNEY DOCKET No.: 29096/37999

a seal operatively connected to the shaft adjacent the wheel case aperture;

annular baffle means for substantially isolating the seal from the interior of the

wheel case, the means carried by the housing cover; and

a plurality of attachment bolts;

a seal assembly disposed on the attachment bolt;

wherein each attachment bolt and the corresponding seal assembly

cooperatively engage the housing and the frame to sealably secure the housing to the

wherein each of the attachment bolts comprises:

a shank;

frame; and

an inner end having a pressed on collar, the inner end and the pressed on collar disposed within the housing and having an inner contact surface, the inner contact surface defined by the pressed on collar; and

an outer end disposed outside the wheel case and having an outer contact surface adjacent the frame; and

wherein the seal assembly comprises:

an inner control washer disposed between the inner contact surface and the housing base, the inner control washer having a first predetermined thickness and further having an aperture therethrough sized to form with the bolt shank an inner annular cavity;

an inner O-ring sized for insertion in the inner annular cavity, the inner O-ring having a second predetermined thickness greater than the first predetermined thickness;

an outer control washer disposed between the outer contact surface and the frame, the outer control washer having a third predetermined thickness and further

GROUP ART UNIT 3653

SERIAL No.: 10/020,647

ATTORNEY DOCKET No.: 29096/37999

having an aperture therethrough sized to form with the bolt shank an outer annular

cavity; and

an outer O-ring sized for insertion in the outer annular cavity, the outer O-ring

having a fourth predetermined thickness greater than the third predetermined thickness;

whereby in response to securement of each attachment bolt by attaching the

pressed on collar each O-ring is compressed to substantially fill its adjacent annular

cavity, thereby preventing the lubricant from escaping the housing and further

preventing the pressed on collar from loosening.

(Previously presented) A vibratory device for vibrating aggregate

material and comprising:

a frame;

7.

a rotating shaft extending transversely across the frame and having a wheel, a

driven portion of the shaft adapted for attachment to a drive system; a wheel housing,

the housing including a base, a peripheral sidewall, and a cover, the housing defining

an interior sized to receive a rotatable wheel, the interior adapted to hold a quantity of

lubricating oil;

an aperture through the cover, the aperture adapted to receive therethrough the

driven portion of the shaft;

a seal operatively engaging the driven portion of the shaft and arranged to

inhibit lubricant from escaping the interior of the housing;

an annular baffle carried by an interior surface of the housing and positioned to

surround the seal and the aperture, a cylindrical end of the baffle cooperating with the

•

wheel to define an annular gap, the baffle sized to minimize the size of the gap, thereby inhibiting the flow of lubricating oil from the wheel toward the seal;

a plurality of sealed attachment bolts for securing the housing to the frame, each attachment bolt including a shank;

at least a washer mounted on the shank, the washer having an aperture therethrough sized to form an annular cavity with the shank; and

at least an O-ring sized for insertion in the annular cavity, the O-ring having a thickness greater than a thickness of the washer;

wherein in response to securement of the attachment bolt, the O-ring is compressed to substantially fill the annular cavity, thereby preventing the lubricant from escaping.

8. (Currently amended) [[The device of claim 5,]] A sealed wheel case for use on a vibratory device for vibrating aggregate material, the vibratory device having a frame and a rotating shaft extending transversely across the frame and having a wheel, a driven portion of the shaft being operatively coupled to a drive system, the sealed wheel case comprising:

a housing having a base, a peripheral sidewall, and a cover, the housing defining an interior sized to receive the wheel, the housing adapted to hold quantity of lubricating oil for lubricating the wheel, the cover including an aperture adapted to receive therethrough the driven portion of the shaft;

a seal operatively connected to the shaft adjacent the wheel case aperture;

annular baffle means for substantially isolating the seal from the interior of the wheel case, the means carried by the housing cover;

SERIAL NO.: 10/020,647 ATTORNEY DOCKET NO.: 29096/37999

a plurality of attachment bolts;

a seal assembly disposed on the attachment bolt;

wherein each attachment bolt and the corresponding seal assembly

cooperatively engage the housing and the frame to sealably secure the housing to the

frame; and

wherein the seal is a labyrinth seal.

9. (Currently amended) [[The device of claim 5,]] A sealed wheel case for

use on a vibratory device for vibrating aggregate material, the vibratory device having a

frame and a rotating shaft extending transversely across the frame and having a wheel,

a driven portion of the shaft being operatively coupled to a drive system, the sealed

wheel case comprising:

a housing having a base, a peripheral sidewall, and a cover, the housing defining

an interior sized to receive the wheel, the housing adapted to hold quantity of

lubricating oil for lubricating the wheel, the cover including an aperture adapted to

receive therethrough the driven portion of the shaft;

a seal operatively connected to the shaft adjacent the wheel case aperture;

annular baffle means for substantially isolating the seal from the interior of the

wheel case, the means carried by the housing cover;

a plurality of attachment bolts;

a seal assembly disposed on the attachment bolt;

wherein each attachment bolt and the corresponding seal assembly

cooperatively engage the housing and the frame to sealably secure the housing to the

frame; and
